

a Paired McNemar comparisons, mean net images over 3 seeds

Exact McNemar test on paired per-image correctness, run separately per seed; ● marks each seed reaching $p < 0.05$ (3 seeds per cell).

Positive values favour the first-named arm. [†]trained for 100 epochs under the pre-registered convergence rule; all others 50.

Panel b: horizontal bars are the 3-seed mean, points are individual seeds (filled = $p < 0.05$); bounds widen rotation, translation and crop together.

b z^* : adaptivity vs constant strength as the operator bounds widen
